                                                                                                                                                                                                                                                                                                                                                                                                                       SUBCELLULAR LOCATION: Outer membrane.

MISCELLANEOUS: THIS PROTEIN IS SUBJECT TO PHASE-VARIABLE
EXPRESSION ASSOCIATED WITH ALTERATION IN THE LENTH OF THE CCAA
REPEAT REGION. THIS MECHANISM IS CALLED SILPPED-STRAND MISPAIRING
ADDITION OR LOSS OF CCAA REPEAT UNITS WOULD CHANGE THE READING
FRAME AND RESULT IN INTRODUCTION OF STOP CODONS DOWNSTREAM OF THE
REPEAT REGION. THIS MAY BE A MECHANISM OF REGULATION AND A
WAY TO AVOID THE IMMUNICOLAL RESPONSE OF THE HOST.
SIMILARITY: BELONGS TO THE TONN-DEPENDENT RECEPTOR PROTEIN FAMILY,
HEMOGLOBIN/HAPTOGLOBIN BINDING PROTEIN SUBFAMILY.
                                                                                                                                                                                                                                           Ren Z., Jin H., Morton D.J., Stull T.L.;

           SUBCELLULAR LOCATION: OUTER membrane.

MISCELLANEOUS: THIS PROTEIN IS SUBJECT TO PHASE-VARIABLE
EXPRESSION ASSOCIATED WITH ALTERATION IN THE LENGTH OF THE CCAA
REPEAT REGION. THIS MECHANISM IS CALLED SLIPPED-STRAND MISPAIRING.
ADDITION OR LOSS OF CCAA REPEAT UNITS WOULD CHANGE THE READING
FRAME AND REGILT IN INTRODUCTION OF STOP CODONS DOWNSTREAM OF THE
REPEAT REGION. THIS MAY BE A MECHANISM OF REGULATION AND A
MAX TO AVOID THE IMMUNICGICAL RESPONSE OF THE HOST.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

             The present sequence represents a BASBO24 outer membrane protein Neisseria meningitidis. The BASBO24 polynucleotide sequence was first identified in the Incyte Pathoseq database containing unfinished genomic DNA sequence of N. meningitidis. BASBO24 polypeptides and polynucleotides are useful for generating an immune response in an animal. Antibodies specific BASBO24 pare useful for treating an are useful for treating in meningitidis infection, which causes bacteremia and meningitis.

The present sequence represents a BASBO24 outer membrane protein of Neisseria meningitidis. The BASBO24 polynucleotide sequence was first identified in the Incyte Pathosed database containing unfinished genomic DNA sequence of N. meningitidis. BASBO24 polypeptides and polynucleotides are useful for generating an immune response in an animal. Antibodies specific BASBO24 polypeptides are useful for treating N. meningitidis infection, which causes bacteremia and meningitis.

The present sequence represents a BASBO24 outer membrane protein of Neisseria meningitidis. The BASBO24 polynucleotide sequence was first identified in the Incyte Pathoseq database containing unfinished genomic DNA sequence of N. meningitidis. BASBO24 polypeptides and polynucleotides are useful for generating an immune response in an animal. Antibodies specific BASBO24 pate useful for treating N. meningitidis infection, which causes bacteremia and meningitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   180

They are encoded by open reading frames (OREs) AAZ11972-Z12358. The antigenic proteins, their fucleic acids and antibodies are used for diagnosis, prevention (as vaccines) or treatment of Neisseria infections, such as meningitis, septicaemia and gonorrhea. Both organisms are closely related. Fragments of the nucleic acids

They are encoded by open reading frames (ORFs) AAZ11972-Z12358. The antigenic proteins, their fragments, their nucleic acids and antibodies are used for diagnosis, prevention (as vaccines) or treatment of Neisseria infections, such as meningitis, septicaemia and gonorrhea. Both organisms are closely related fragments of the nucleic acids are useful as hybridisation probes and antisense reagents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 120

                                                                                                                                                   Amino acid sequences AAV38499-Y38944 represent Neisseria meningit and N. gonorrhoeae antiqenic proteins. They are encoded by open reading frames (ORFs) AAZ11972-Z1Z358. The antigenic proteins, their fragments, their nucleic acids and antibodies are used for diagnosis, prevention (as vaccines) or treatment of Neisseria infections, such as meningitis, septicaemia and gonorrhea. Both organisms are closely related. Fragments of the nucleic acids are useful as hybridisation probes and antisense reagents.

They are encoded by open reading frames (ORFs) AAZ11972-212358. The antigenic proteins, their fragments, their nucleic acids and antibodies are used for diagnosis, prevention (as vaccines) or treatment of Neisseria infections, such as meningitis, septicaemia and gonorrhea. Both organisms are closely related. Fragments of the nucleic acids are useful as hybridisation probes and antisense reagents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        meningitidis; Neisseria gonorrhoeae; antigen; vaccine;

It is encoded by DNA from Moraxella catarrhalis strain Mc2931 (ATCC 43617). BASB021 polynucleotides and polypeptides may be used for prognosis, staging of disease, determining response to drug treatment and drug screening. They can be used in vaccines for generating an immuresponse and for preventing or treating Moraxella infections which may cause otitis media, pneumonia, sinusitis, nosocomial infections and invasive diseases, anditive nerve damage, delayed speech learning, infection of upper respiratory tract and inflammation of the middle ear Anti-BASB021 antibodies can be used to diagnose and treat Moraxella
